

Machine Learning Nanodegree

Syllabus

Artificial Neural Networks, TensorFlow, and Machine Learning Algorithms

Before You Start

Prerequisites: In order to succeed in this program, we recommend having experience programming in Python, knowledge of inferential statistics, probability, linear algebra and calculus. If you've never programmed before, or want a refresher, you can prepare for this Nanodegree with Lessons 1-4 of [Intro to Computer Science](#).

Educational Objectives: This program will teach you how to become a Machine Learning Engineer, build Machine Learning models and apply them to data sets in fields like finance, healthcare, education, and more.

Length of Program: The program is divided into two terms of 3 months each. We expect students to work 10 hours/week on average. Estimated time commitment to complete both terms is 200 hours.

*The length is an estimation of total hours the average student may take to complete all required coursework, including lecture and project time. Actual hours may vary.

Instructional Tools Available: Video lectures, personalized project reviews, dedicated mentor

TERM 1: MACHINE LEARNING FOUNDATIONS

Model Evaluation and Validation Project 1: Predicting Boston Housing Prices

The Boston housing market is highly competitive, and you want to be the best real estate agent in the area. To compete with your peers, you decide to leverage a few basic machine learning concepts to assist you and a client with finding the best selling price for their home. Luckily, you've come across the Boston Housing dataset which contains aggregated data on various features for houses in Greater

Boston communities, including the median value of homes for each of those areas. Your task is to build an optimal model based on a statistical analysis with the tools available. This model will then be used to estimate the best selling price for your clients' homes.

Supporting Lesson Content: Model Evaluation and Validation

Lesson Title	Learning Outcomes
TRAINING AND TESTING MODELS	→ Load data with Pandas, then train and test models with Scikit-learn.
EVALUATION METRICS	→ Learn about metrics such as accuracy, precision, and recall used to measure the performance of your models.
EVALUATION AND VALIDATION	→ Choose the best model using cross-validation and grid search.

Supervised Learning Project 2: Find Donors for CharityML

CharityML is a fictitious charity organization located in the heart of Silicon Valley that was established to provide financial support for people eager to learn machine learning. After nearly 32,000 letters sent to people in the community, CharityML determined that every donation they received came from someone that was making more than \$50,000 annually. To expand their potential donor base, CharityML has decided to send letters to residents of California, but to only those most likely to donate to the charity. With nearly *15 million* working Californians, CharityML has brought you on board to help build an algorithm to best identify potential donors and reduce overhead cost of sending mail. Your goal will be evaluate and optimize several different supervised learners to determine which algorithm will provide the highest donation yield while also reducing the total number of letters being sent.

Supporting Lesson Content: Supervised Learning

Lesson Title	Learning Outcomes
LINEAR REGRESSION	→ Difference between Regression and Classification → Learn to predict values with Linear Regression
PERCEPTRON ALGORITHM	→ Learn the definition of a perceptron as a building block for neural networks, and the perceptron algorithm for classification.
LOGISTIC REGRESSION	→ Learn to predict states using Logistic Regression

NEURAL NETWORKS	<ul style="list-style-type: none"> → Learn the definition of a Neural Network → Learn to train them using backpropagation → Build a neural network starting from a single perceptron
DECISION TREES	<ul style="list-style-type: none"> → Train Decision Trees to predict states → Use Entropy to build decision trees recursively → Random forests
NAIVE BAYES	<ul style="list-style-type: none"> → Learn the Bayes rule, and how to apply it to predicting data using the Naive Bayes algorithm → Train models using Bayesian Learning → Use Bayesian Inference to create Bayesian Networks of several variables → Bayes NLP Mini-Project
SUPPORT VECTOR MACHINES	<ul style="list-style-type: none"> → Learn to train a Support Vector Machine to separate data linearly → Use Kernel Methods in order to train SVMs on data that is not linearly separable
ENSEMBLE OF LEARNERS	<ul style="list-style-type: none"> → Enhance traditional algorithms via boosting → AdaBoost

Unsupervised Learning Project 3: Creating Customer Segments

In this project you will apply unsupervised learning techniques on product spending data collected for customers of a wholesale distributor in Lisbon, Portugal to identify customer segments hidden in the data. You will first explore the data by selecting a small subset to sample and determine if any product categories highly correlate with one another. Afterwards, you will preprocess the data by scaling each product category and then identifying (and removing) unwanted outliers. With the good, clean customer spending data, you will apply PCA transformations to the data and implement clustering algorithms to segment the transformed customer data. Finally, you will compare the segmentation found with an additional labeling and consider ways this information could assist the wholesale distributor with future service changes.

Supporting Lesson Content: Unsupervised Learning

Lesson Title	Learning Outcomes
CLUSTERING	<ul style="list-style-type: none"> → Learn the basics of clustering Data → Cluster data with the K-means algorithm

Want to explore more or need guidance?
Call us at 1800-121-6240 to speak with our enrollments specialists

HIERARCHICAL AND DENSITY-BASED CLUSTERING	<ul style="list-style-type: none"> → Cluster data with Single Linkage Clustering → Cluster data with DBSCAN, a clustering method that captures the insight that clusters are dense groups of points.
GAUSSIAN MIXTURE MODELS	<ul style="list-style-type: none"> → Cluster data with Gaussian Mixture Models → Optimize Gaussian Mixture Models with Expectation Maximization
FEATURE SCALING	<ul style="list-style-type: none"> → Learn to scale features in your data → Learn to select the best features for training data
DIMENSIONALITY REDUCTION	<ul style="list-style-type: none"> → Reduce the dimensionality of the data using Principal Component Analysis and Independent Component Analysis

TERM 2: ADVANCED MACHINE LEARNING

Project 4: Dog Breed Classifier

In this project, you will learn how to build a pipeline that can be used within a web or mobile app to process real-world, user-supplied images. Given an image of a dog, your algorithm will identify an estimate of the canine's breed. If supplied an image of a human, the code will identify the resembling dog breed. Along with exploring state-of-the-art CNN models for classification, you will make important design decisions about the user experience for your app. Our goal is that by completing this lab, you understand the challenges involved in piecing together a series of models designed to perform various tasks in a data processing pipeline. Each model has its strengths and weaknesses, and engineering a real-world application often involves solving many problems without a perfect answer. Your imperfect solution will nonetheless create a fun user experience!

Supporting Lesson Content: Deep Learning

Lesson Title	Learning Outcomes
MACHINE LEARNING TO DEEP LEARNING	<ul style="list-style-type: none"> → The basics of deep learning, including softmax, one-hot encoding, and cross entropy. → Basic linear classification models such as Logistic Regression, and their associated error function.
DEEP NEURAL NETWORKS	<ul style="list-style-type: none"> → Review: What is a Neural Network? → Activation functions, sigmoid, tanh, and ReLus. → How to train a neural network using backpropagation and the chain rule. → How to improve a neural network using techniques such as regularization and dropout.

Want to explore more or need guidance?
Call us at 1800-121-6240 to speak with our enrollments specialists

Project 5: Train a Quadcopter to Fly

In this project, you will design an agent that can fly a quadcopter, and then train it using a reinforcement learning algorithm of your choice. You will apply the techniques you have learnt in this module to find out what works best, but you will also have the freedom to come up with innovative ideas and test them on your own. The project is divided into 4 sections which cover different aspects of getting the quadcopter to fly such as taking off, hovering, landing and so on.

Supporting Lesson Content: Reinforcement Learning

Lesson Title	Learning Outcomes
WELCOME TO RL	→ The basics of reinforcement learning and OpenAI Gym.
THE RL FRAMEWORK: THE PROBLEM	→ Learn how to define Markov Decision Processes to solve real-world problems.
THE RL FRAMEWORK: THE SOLUTION	→ Learn about policies and value functions. → Derive the Bellman Equations.
DYNAMIC PROGRAMMING	→ Write your own implementations of iterative policy evaluation, policy improvement, policy Iteration, and value Iteration.
MONTE CARLO METHODS	→ Implement classic Monte Carlo prediction and control methods. → Learn about greedy and epsilon-greedy policies. → Explore solutions to the Exploration-Exploitation Dilemma.
TEMPORAL-DIFFERENCE METHODS	→ Learn the difference between the Sarsa, Q-Learning, and Expected Sarsa algorithms.
RL IN CONTINUOUS SPACES	→ Learn how to adapt traditional algorithms to work with continuous spaces.
DEEP Q-LEARNING	→ Extend value-based reinforcement learning methods to complex problems using deep neural networks.
POLICY GRADIENTS	→ Policy-based methods try to directly optimize for the optimal policy. Learn how they work, and why they are important, especially for domains with continuous action spaces.

Project 6: Capstone Proposal

In this capstone project proposal, prior to completing the following Capstone Project, you will leverage what you've learned throughout the Nanodegree program to author a proposal for solving a problem of your choice by applying machine learning algorithms and techniques. A project proposal encompasses seven key points:

- The project's domain background — the field of research where the project is derived;
- A problem statement — a problem being investigated for which a solution will be defined;
- The datasets and inputs — data or inputs being used for the problem;
- A solution statement — a the solution proposed for the problem given;
- A benchmark model — some simple or historical model or result to compare the defined solution to;
- A set of evaluation metrics — functional representations for how the solution can be measured;
- An outline of the project design — how the solution will be developed and results obtained.

Project 7: Capstone Project

In this capstone project, you will leverage what you've learned throughout the Nanodegree program to solve a problem of your choice by applying machine learning algorithms and techniques. You will first define the problem you want to solve and investigate potential solutions and performance metrics. Next, you will analyze the problem through visualizations and data exploration to have a better understanding of what algorithms and features are appropriate for solving it.

You will then implement your algorithms and metrics of choice, documenting the preprocessing, refinement, and postprocessing steps along the way. Afterwards, you will collect results about the performance of the models used, visualize significant quantities, and validate/justify these values. Finally, you will construct conclusions about your results, and discuss whether your implementation adequately solves the problem.
